Project Update 3

Clark Kirby

10/2/2026

So far nothing has been done from a mobile programming standpoint on this project, but the pipeline for running the Monte Carlo simulation based on player descriptions has been built and tested. Before the UI and mobile application are built, I would like to make sure the back-end processes are functioning correctly, then put a pretty coat of paint over the prompting and simulations to create the app.

Below is an example UI that will be a rough guide of what we hope to present to the user. The main focus is the heatmap that should display all necessary information at a glance, with the option to select player positions and player opens.

Below is an example of the UI used to simulate the villains at the table which will use a basic prompt to an LLM to quantify the villains' tendencies into a trainable heuristic to pass to the simulation
